Sources

1. The earliest beetle records we have, apart from Wordsworth's glow-worms in 1802, date back to T.C.Heysham in the 1830s. But systematic recording, for Cumberland, V.C.70, was initiated by F.H.Day of Carlisle, in five papers published in the *Transactions of Carlisle N.H.S.* in 1909 to 1933. Day's large beetle collection is housed in Tullie House Museum. He added a bare list of Westmorland species, mainly Britten's in *Naturalist* 1918-1919. The Cumberland total rose from 500 species in 1897 to 1630 in 1908 and 1797 by 1923. Innumerable notes by Day in *E.M.M.*, *Naturalist* and *Ent. Record* increased that to 1855 by 1943. Day's main co-worker, H.Britten of Great Salkeld, contributed many records, of Staphylinidae and Ptiliidae especially, before he left the county in 1912. Apart from a long article in *Ent.Record* 1907 (and *E.M.M.* 1909) most of his data have been gathered from specimens in Manchester Museum.
2. R.W.J.Read of Hensingham concentrated on Curculionidae and Chrysomelidae at first, adding numerous species to the county list. (Articles in *BENHS Transactions* 1982, *Coleopterist's Newsletter* 1988 and 1989.) Since then he has worked on most other families with many notes in various entomological journals.
3. D.B.Atty retired from Gloucestershire to Embleton in 1988, and has now recorded 1450 species in Cumbria. Some of the more interesting finds were published in *Ent.Record* 1996 and *Coleopterist* 2009.
4. Many other coleopterists have contributed records since 1955. They include W.F.Davidson, L.S. Kelly, R.B. Angus, D.Bilton, R.S.Key, L.J.Bauer, K. N.A.Alexander, G.N.Foster, M.Sinclair, J.Thomas and S.M.Hewitt. Some of their records are to be found in the various journals, but most were communicated directly. The total for Cumbria as a whole, including V.C.69 Westmorland and North Lancashire, now stands at 2256 species.
5. My special thanks are due to Stephen Hewitt, Keeper of Natural Sciences at Tullie House: without his enthusiasm and digital expertise there would be no checklist, only *Rudis indigestaque moles*.

Frequency codes

The column headed "Frequency" gives some indication of the commonness or otherwise within Cumbria. It is based on the actual number of records for each species since 1985, in categories numbered as follows:

- 0 Any records were before 1985
- 1 Only one record since 1985
- 2 Very few records since 1985 (2 to 4 or 5)
- 3 Few records (5 to 10)
- 4 10 to 20 records
- 5 20 to 40 records
- 6 40 to 60 records
- 7 More than 60 records.

No allowances have been made for restricted distribution (sea-shore only) or specialised habitat (mammals' nests) or difficult genera, so there is no simple correlation with the loose terminology of "common" or "local" (though category 0 might be labelled "very rare" and 7 "abundant"). However, the categories should, I hope, be broadly comparable within a family or large genus but not between families (e.g. Carabidae v. Cryptophagidae), and for Cumbria only. English Nature's national ratings (local - Notable - Red Data) are not quoted in this checklist. They relate more to distribution over the U.K. and are barely ever relevant to a border county like Cumbria.

Entries in italics are considered dubious Cumbrian species either because they are known imports or introductions or because records are considered to require confirmation
